

AMENDMENTS TO THE ABSTRACT

Please replace the abstract on the cover page with the following rewritten paragraph:

A folding assembly (10) for a vehicle side mirror that employs specialized ramped détentes (58). The folding assembly (10) includes a pivot tube (30) and a pivot spring (32) rotatably coupled to a case frame (16) and rigidly coupled to a base frame (24). The base frame (24) includes a series of ramped détentes (58) that are seated within corresponding recesses (64) in the case frame (16). The inside angle (β_1) of the ramps of the détentes is steeper than the outside angle (β_2) of the ramps of the détentes according to a predetermined formula so that when the case frame (16) is rotated relative to the base frame (24), and the détentes move out of their recesses, the force of the rotation is distributed along the entire length of the ramp to increase the durability performance of the mirror and thus its longevity.
